

## COUNTRY INDICATORS AND SDGS

## TOTAL ENERGY SUPPLY (TES)

Total Energy Supply (TES)	2015	2020
Non-renewable (TJ)	1 705 303	1 270 213
Renewable (TJ)	350 538	450 404
Total (TJ)	2 055 841	1 720 617
Renewable share (%)	17	26

Growth in TES	2015-20	2019-20
Non-renewable (%)	-25.5	-24.3
Renewable (%)	+28.5	+29.0
Total (%)	-16.3	-15.1

Primary energy trade	2015	2020
Imports (TJ)	227 439	188 807
Exports (TJ)	3 896 759	3 468 575
Net trade (TJ)	3 669 320	3 279 768

Imports (% of supply)	11	11
Exports (% of production)	67	85
Energy self-sufficiency (%)	283	236

### Total energy supply in 2020

### Renewable energy supply in 2020

# RENEWABLE ENERGY CONSUMPTION (TFEC)

## Renewable TFEC trend

## Renewable energy consumption in 2020

Consumption by sector	2015	2020
Industry (TJ)	95 458	71 175
Transport (TJ)	267	28 841
Households (TJ)	153 202	177 119
Other (TJ)	269 159	358 107

# ELECTRICITY CAPACITY

## Installed capacity trend

## Renewable capacity in 2022

## Net capacity change (GW)

## Net capacity change in 2022 (MW)

## Capacity utilisation in 2021 (%)

## ELECTRICITY GENERATION

Generation in 2021	GWh	%
<b>Non-renewable</b>	<b>20 622</b>	<b>25</b>
<b>Renewable</b>	<b>63 145</b>	<b>75</b>
Hydro and marine	60 717	72
Solar	530	1
Wind	60	0
Bioenergy	1 839	2
Geothermal	0	0
<b>Total</b>	<b>83 767</b>	<b>100</b>

Per capita electricity generation (kWh)

Electricity generation trend

## LATEST POLICIES, PROGRAMMES AND LEGISLATION

- +H2 Colombia 2022
- 2022 Electricity and gas subsidy for vulnerable households 2022
- 2022 Fuel subsidies 2022
- Resolution 40066/2022. Technical Requirements for the Detection and Repair of Leaks, the Utilisation, Flare and Venting of Natural Gas During Exploration and Production of Hydrocarbons' Activities 2022
- 2050 Climate Change Management plan for the mining and energy sectors 2021

## ENERGY AND EMISSIONS

Energy-related CO<sub>2</sub> emissions by sector

Elec. & heat generation CO<sub>2</sub> emissions in

Avoided emissions from renewable elec. & heat

CO<sub>2</sub> emission factor for elec. & heat generation

Avoided emissions based on fossil fuel mix used for power

Calculated by dividing power sector emissions by elec. + heat gen.

Distribution of solar potential

Distribution of wind potential

Biomass potential: net primary production

Indicators of renewable resource potential

**Solar PV:** Solar resource potential has been divided into seven classes, each representing a range of annual PV output per unit of capacity (kWh/kWp/yr). The bar chart shows the proportion of a country's land area in each of these classes and the global distribution of land area across the classes (for comparison).

**Onshore wind:** Potential wind power density ( $W/m^2$ ) is shown in the seven classes used by NREL, measured at a height of 100m. The bar chart shows the distribution of the country's land area in each of these classes compared to the global distribution of wind resources. Areas in the third class or above are considered to be a good wind resource.

**Biomass:** Net primary production (NPP) is the amount of carbon fixed by plants and accumulated as biomass each year. It is a basic measure of biomass productivity. The chart shows the average NPP in the country (tC/ha/yr), compared to the global average NPP of 3-4 tonnes of carbon

**Sources:** IRENA statistics, plus data from the following sources: UN SDG Database (original sources: WHO; World Bank; IEA; IRENA; and UNSD); UN World Population Prospects; UNSD Energy Balances; UN COMTRADE; World Bank World Development Indicators; EDGAR; REN21 Global Status Report; IEA-IRENA Joint Policies and Measures Database; IRENA Global Atlas; and World Bank Global Solar Atlas and Global Wind Atlas.

**Additional notes:** Capacity per capita and public investments SDGs only apply to developing areas. Energy self-sufficiency has been defined as total primary energy production divided by total primary energy supply. Energy trade includes all commodities in Chapter 27 of the Harmonised System (HS). Capacity utilisation is calculated as annual generation divided by year-end capacity x 8,760h/year. Avoided emissions from renewable power is calculated as renewable generation divided by fossil fuel generation multiplied by reported emissions from the power sector. This assumes that, if renewable power did not exist, fossil fuels would be used in its place to generate the same amount of power and using the same mix of fossil fuels. In countries and years where no fossil fuel generation occurs, an average fossil fuel emission factor has been used to calculate the avoided emissions.

These profiles have been produced to provide an overview of developments in renewable energy in different countries and areas. The IRENA statistics team would welcome comments and feedback on its structure and content, which can be sent to [statistics@irena.org](mailto:statistics@irena.org).
