Agenda

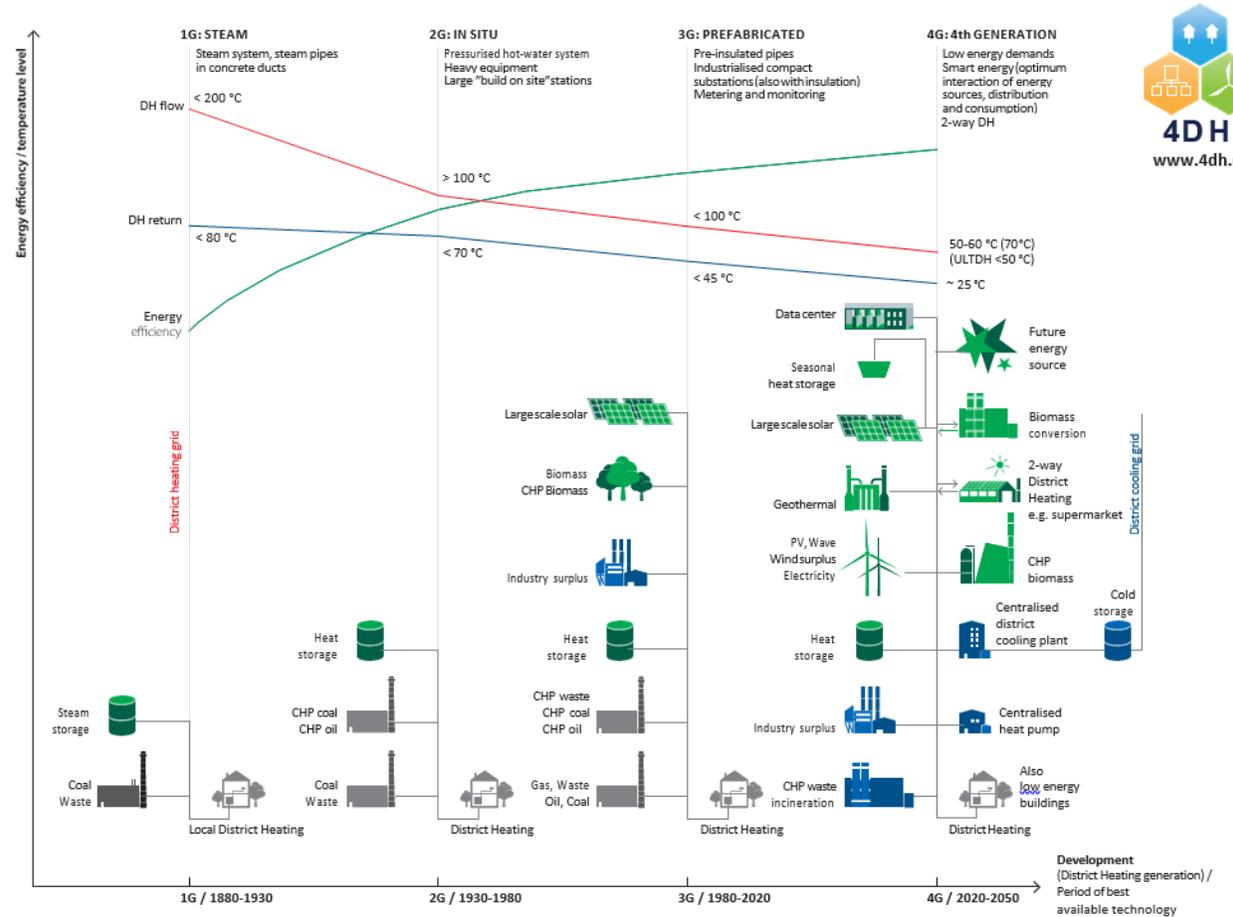

- **Introduction**
- **Strategic heat planning:**
 - **Identifying and involving stakeholders**
 - **Constructing technical scenarios**
 - **Framework conditions, financing and business models**
- **Conclusions and summary**

Introduction

Heating is the largest end-use in Europe

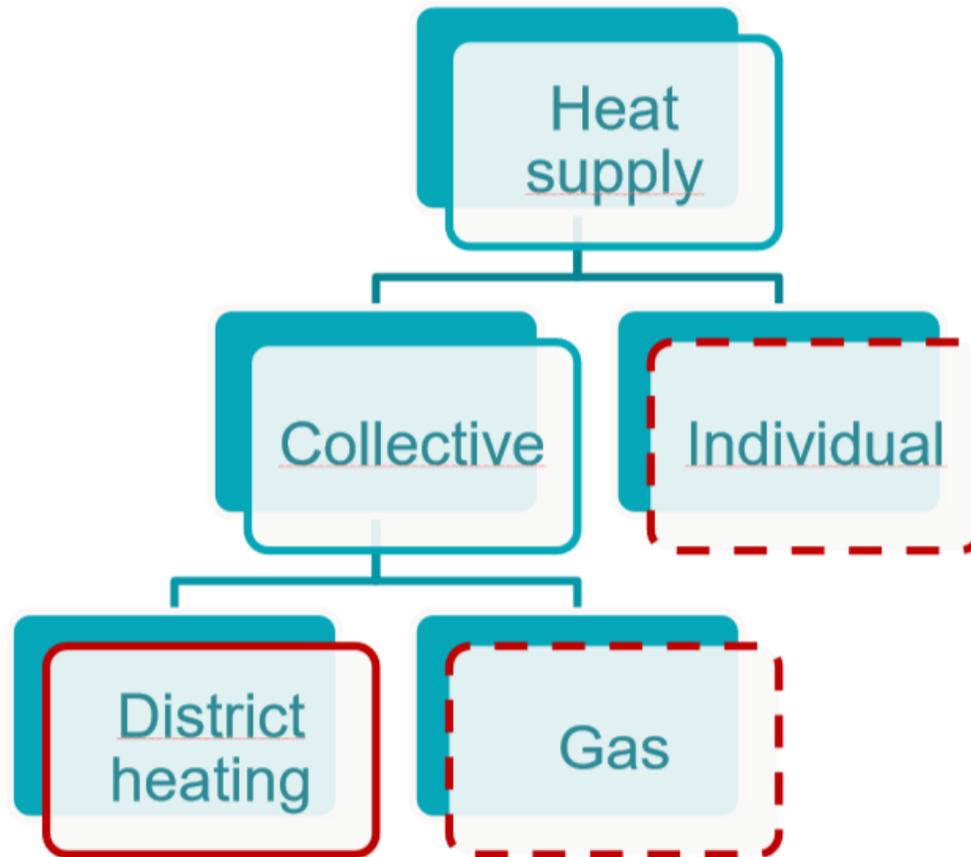

District heating allows access to many supply sources

Smart energy systems and sector coupling

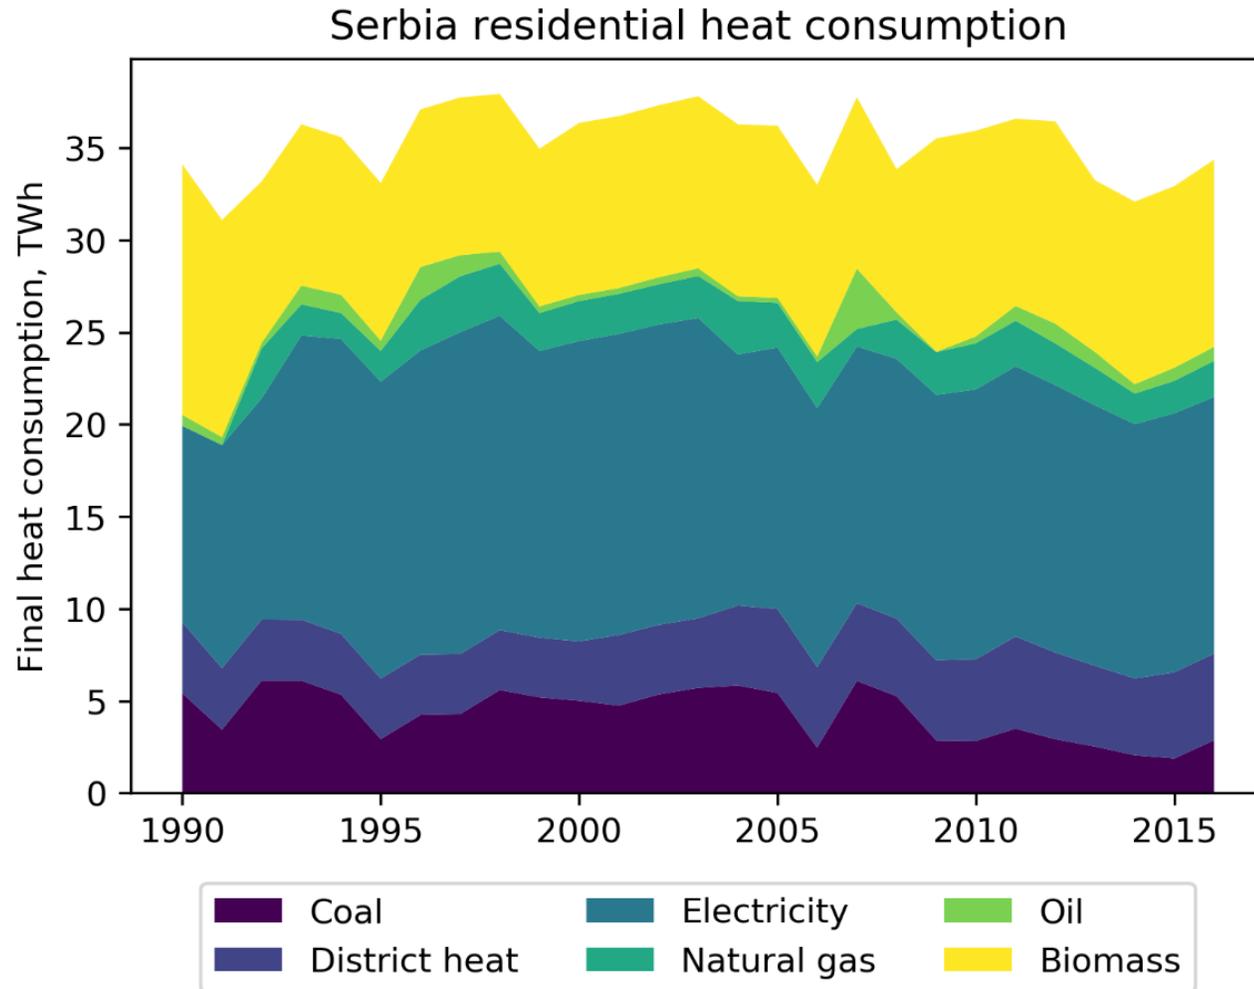

Types of heating infrastructures

Strategic heat planning for collective large-scale infrastructures

Introduction – Serbian residential heat consumption

Heat planning and governance

Heating is a local demand

- Unlike electricity and gas, heating is situated locally
- Often overlooked in national energy policy

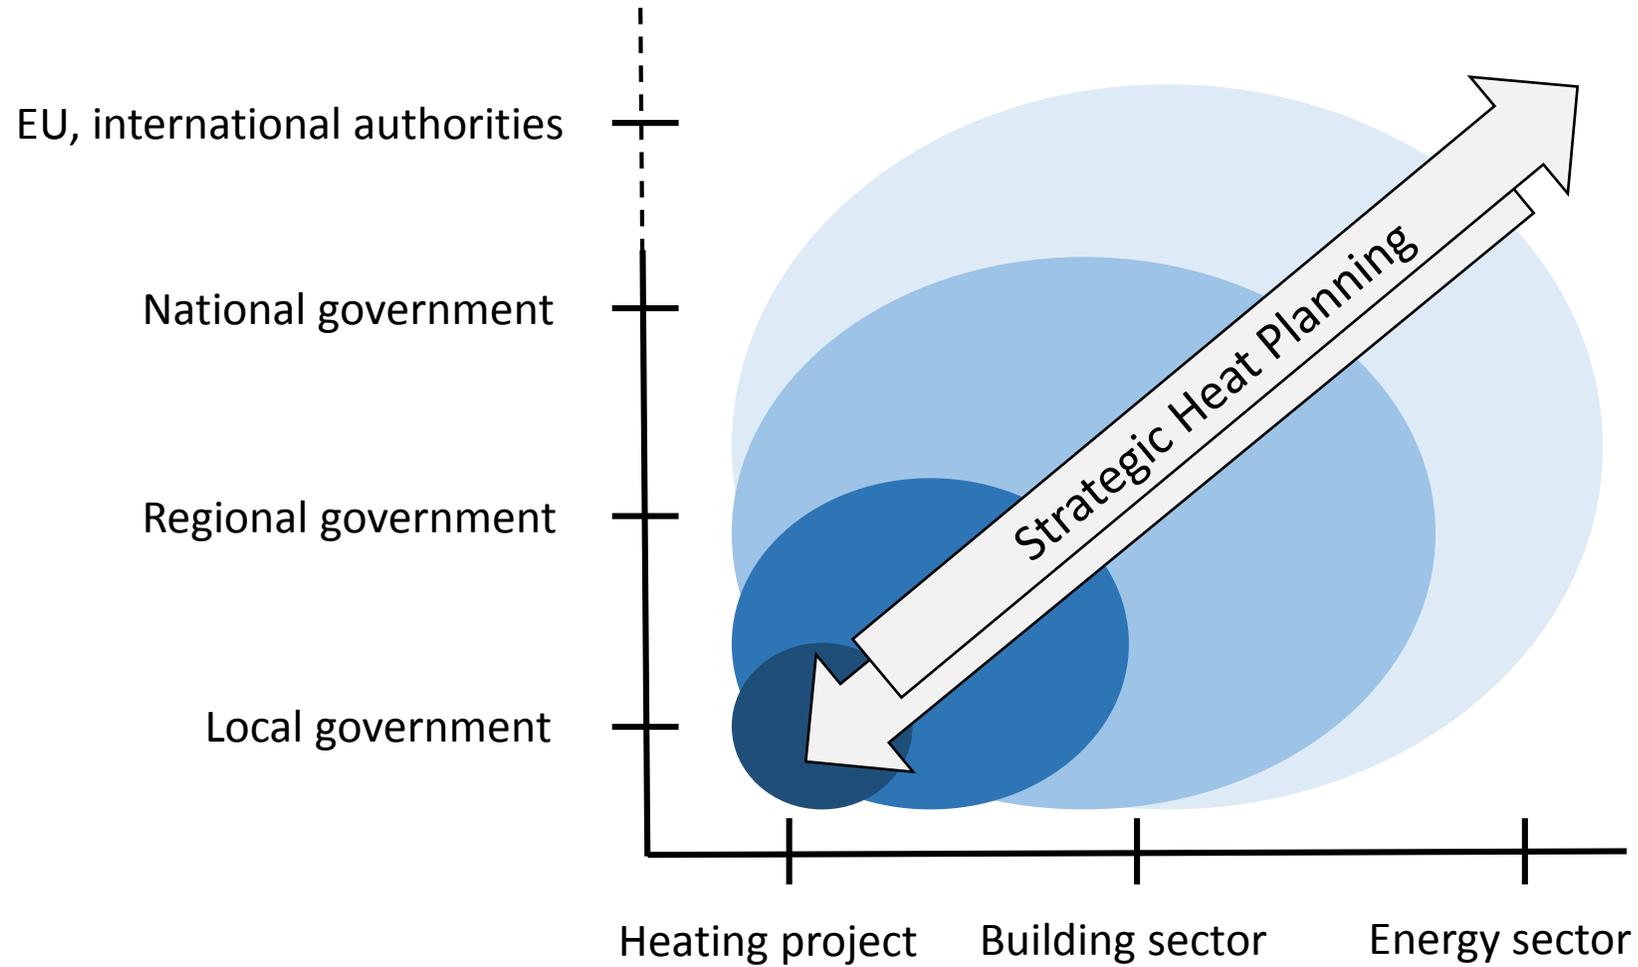

If not treated systematically in energy policy and governance:

- Significant sector coupling and synergies are missed
- Many renewable or efficient heat sources are not considered

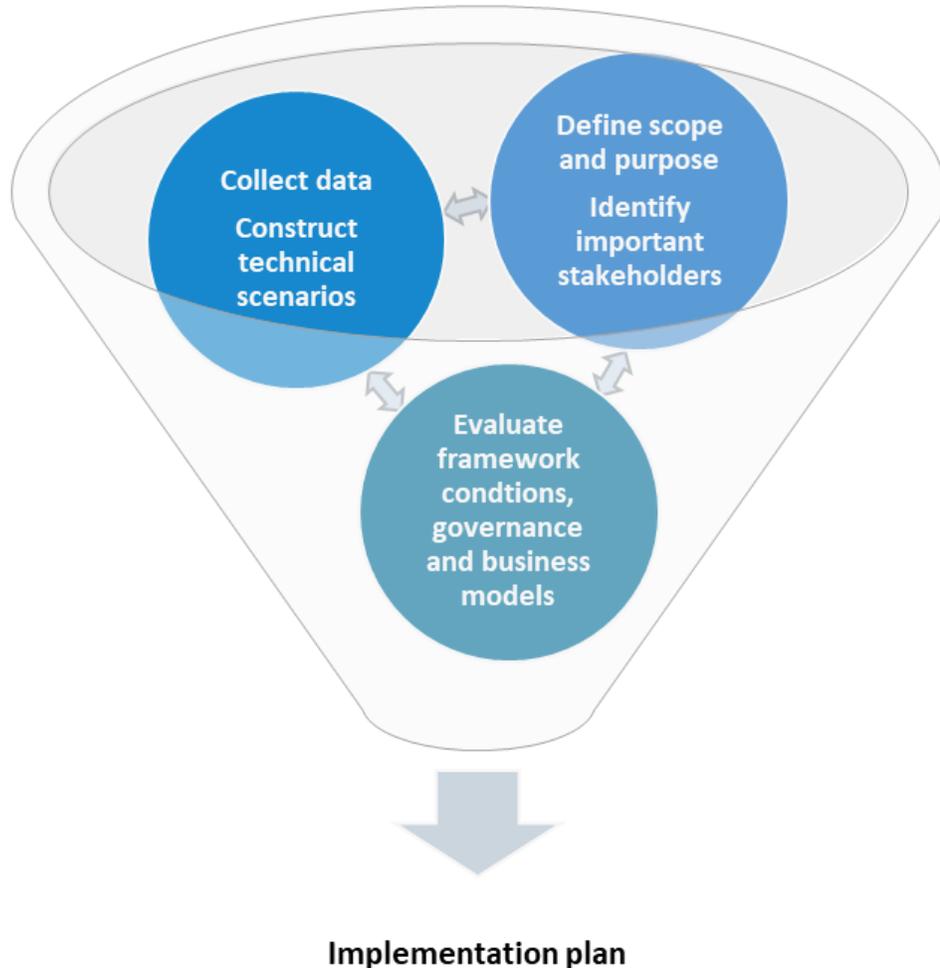

Strategic energy planning

- The purpose of Strategic Energy Planning is to **address issues** with current energy supply and to **formulate strategies** and plans for transitions.
- Strategic heat and cooling planning does differ from planning for other energy carriers due to the **local nature of heating and cooling** supply.
- **Interdisciplinary:** available resources, energy demands, technical potentials, current legislation, the organisation of the energy sector and the related actors, political drivers and barriers should be considered

The context of Strategic heat planning

Key success factors in a Strategic Planning Process

Scope and purpose

- Identify main stakeholders
- Identify drivers for district heating projects

Technical scenarios

- Measure heat demand
- Identify potential heat sources
- Balance heat savings and supply
- Establish scenarios

Evaluate Framework conditions and business models

- Ownership
- Financing
- Pricing
- Regulation

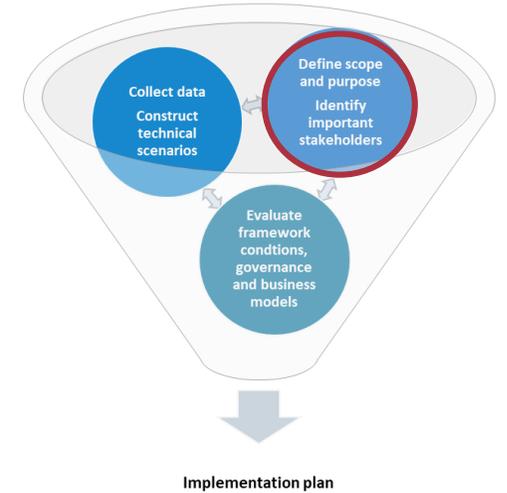

Scope, Purpose and Stakeholders in Strategic Heat Planning

Scope, Purpose and Stakeholders

- Important to identify drivers of the strategic energy planning process:
 - Climate change, energy security, pollution, energy poverty etc..
 - Multiple drivers are likely to exist: important to figure out which ones align

Identification and coordination of stakeholders

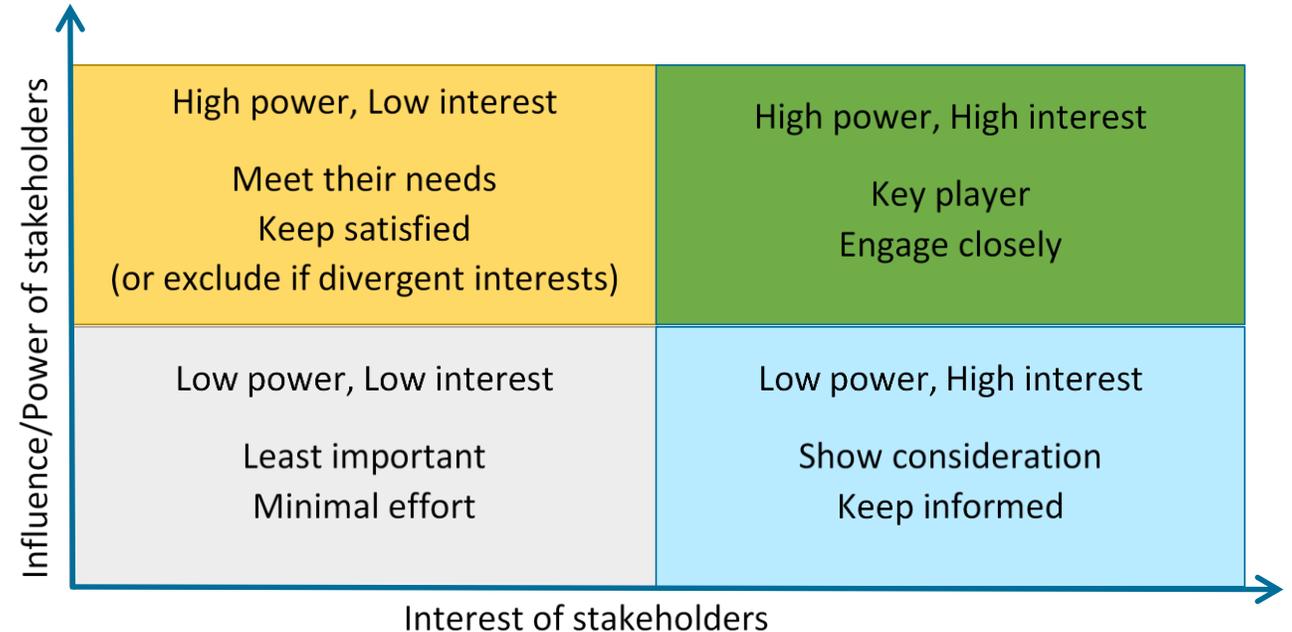

- *Who are* the main actors engaged in the process
 - Industry, high demand consumers, consumers with special needs
- Identifying opportunities to involve stakeholders that can play a constructive role in realizing heat plans
- Identifying synergies and opportunities for cost-effective district energy systems

Scope, Purpose and Stakeholders in Strategic Heat Planning

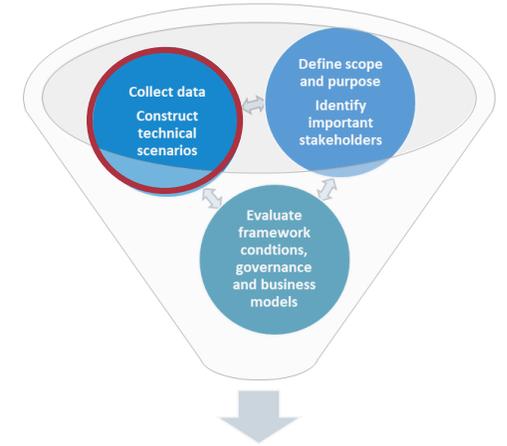

Some Stakeholders to Consider:

- National Authorities
- Local Authorities
- Utility Companies
- Investors
- Researcher / Academia
- Developers
- Technology developers: geothermal, solar thermal, PV, wind etc.
- Excess heat suppliers: industry
- Customers and Citizens

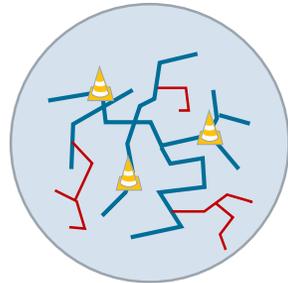

Scenario building

1. Quantify and locate heat demand
2. Quantify and locate heat resources
3. Quantify and assess heat-saving potentials
4. Establish scenarios for heat supply

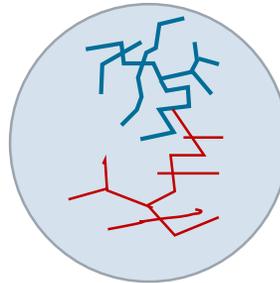

Implementation plan

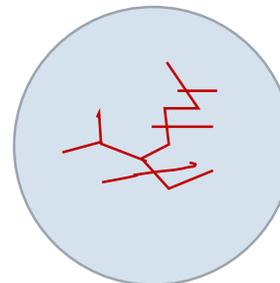

Renovation and expansion of existing district energy

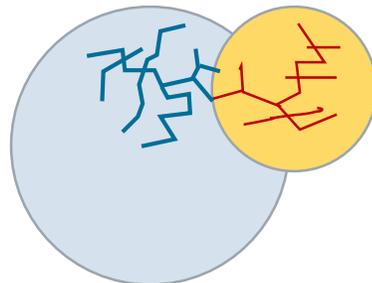

Connecting existing area to existing district energy

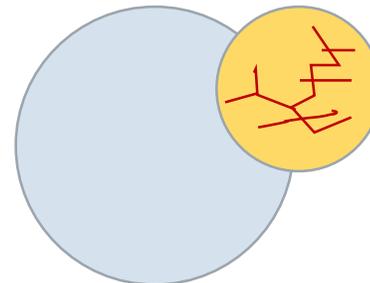

New district energy for an existing area

Connecting new development area to existing district heating

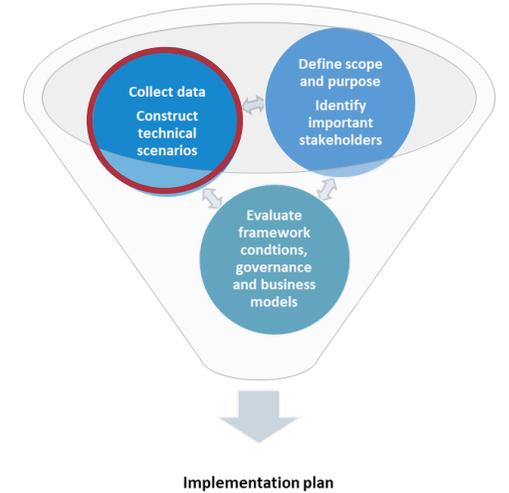

New district energy for new development area

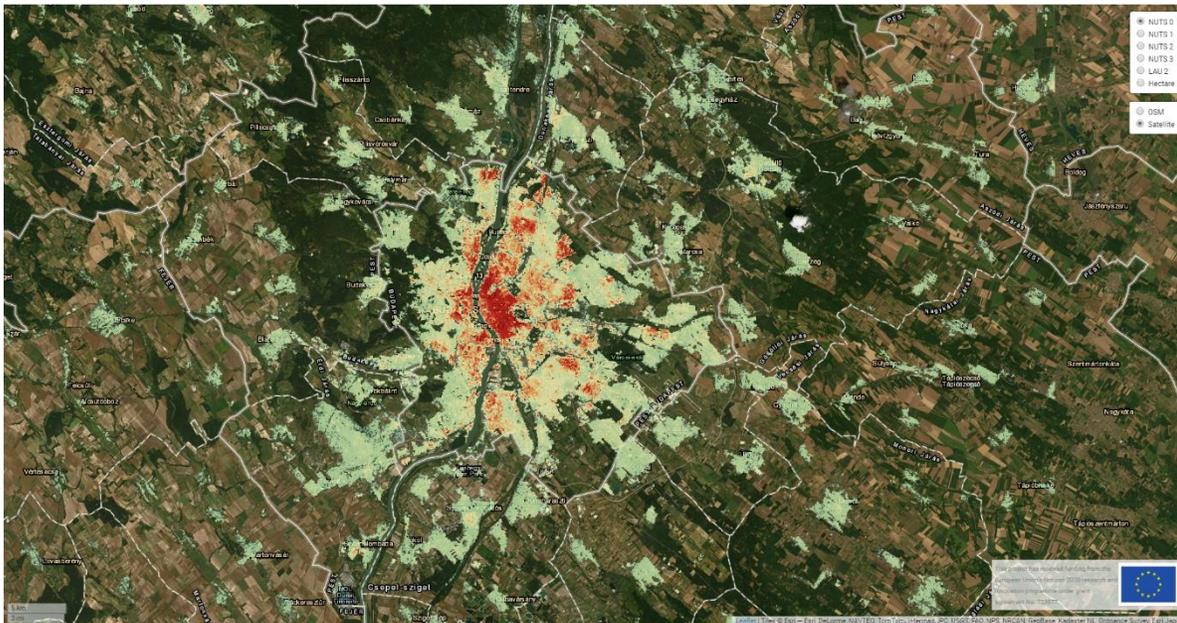

Scenario building for strategic heat planning

1. Quantify and locate demands

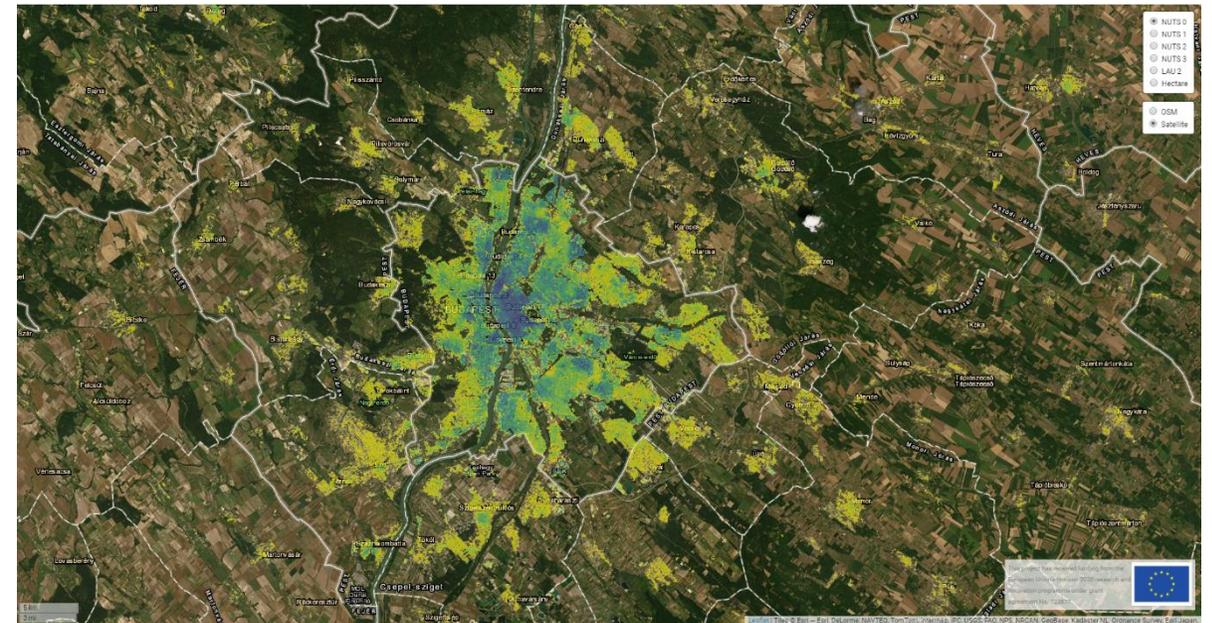

- **Measurements** of actual demands allow for actual knowledge of distribution of consumption.
- **Modelling** or estimating demands can be a way forward to provide inputs for decision making – see for example [Peta4](#) and [Hotmaps](#).

Heating demand Budapest

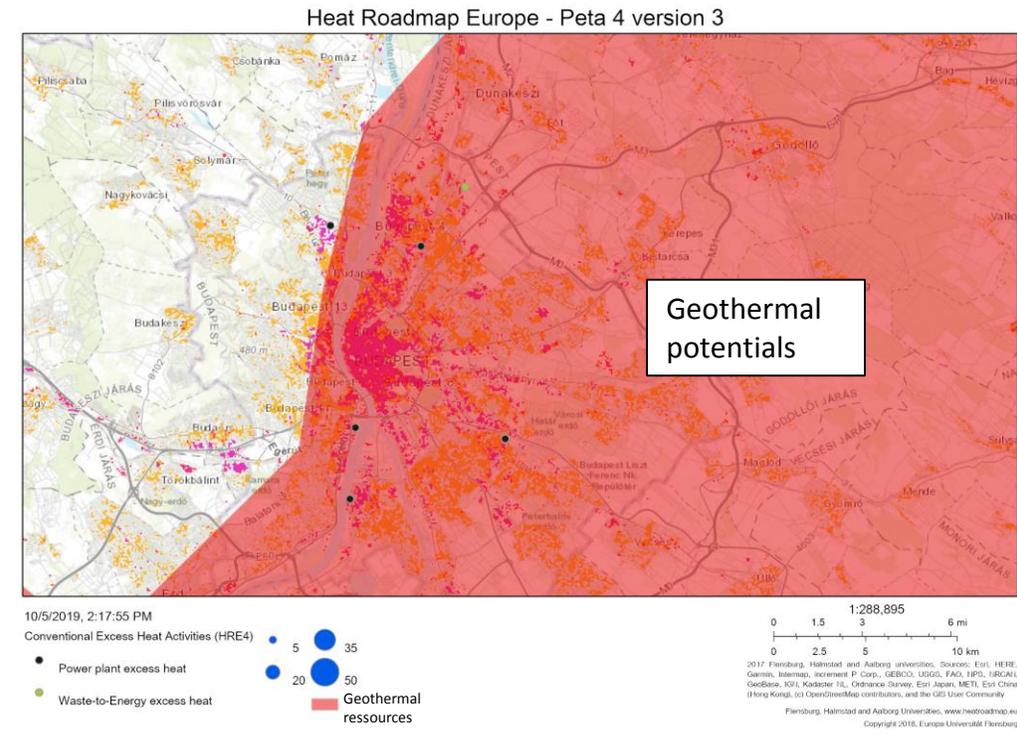

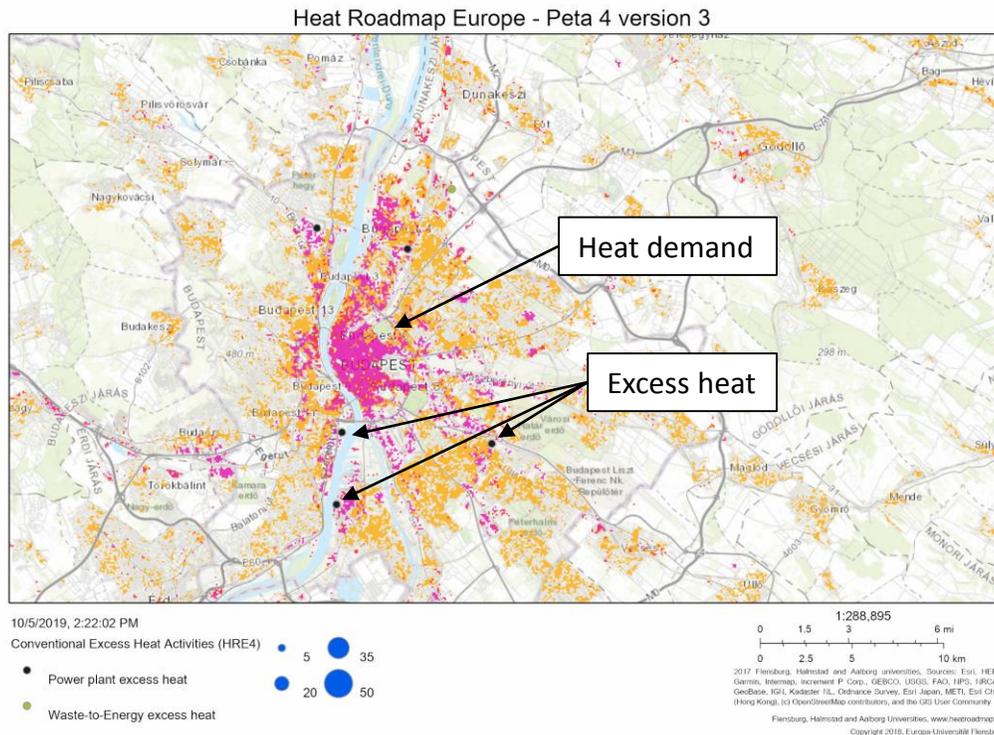

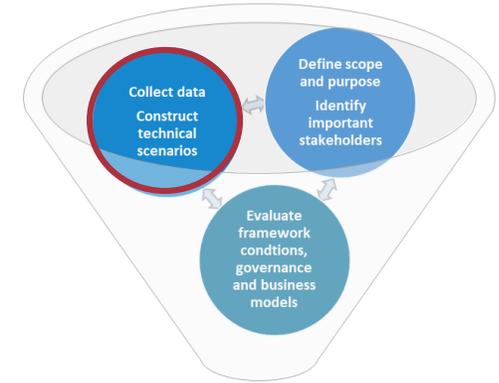

Cooling demand Budapest

Scenario building for strategic heat planning

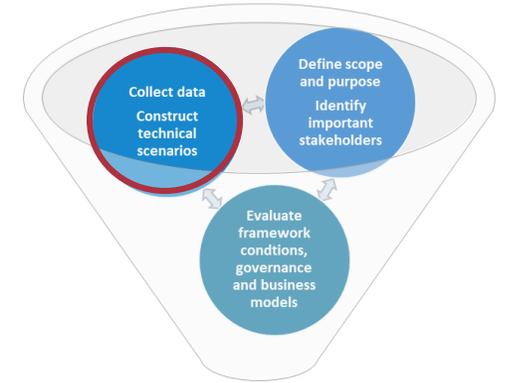

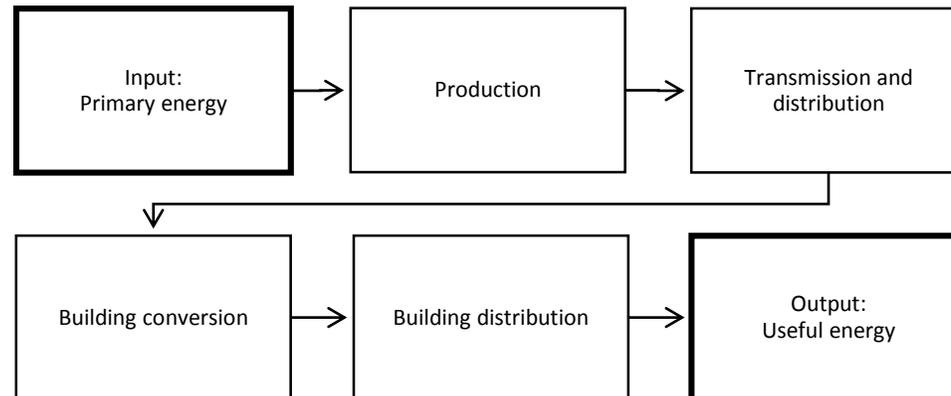

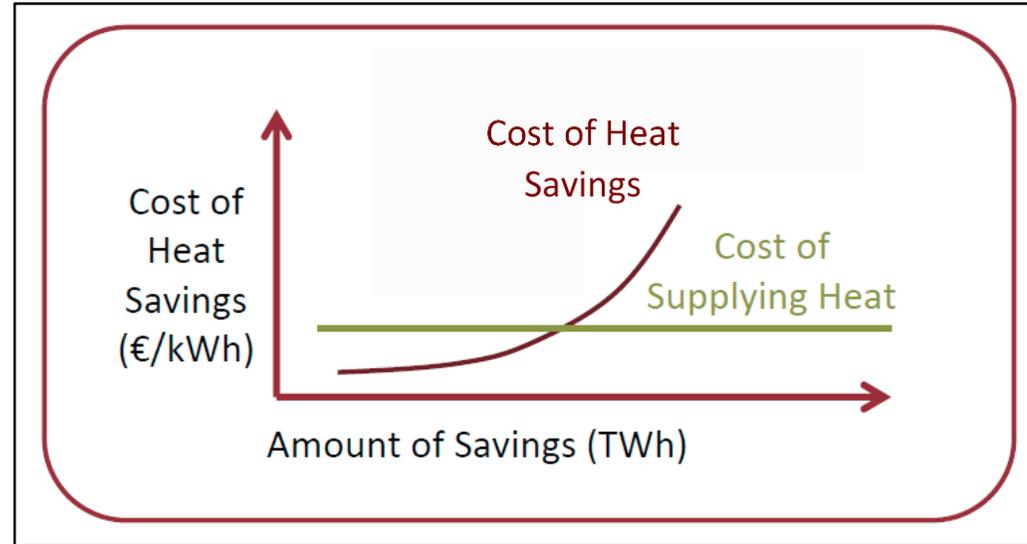

2. Quantify and locate heat resources

- Strategic heat sources are typically either excess heat or renewable sources
- Low district heating supply temperature enables the use of low temperature geothermal resources
- Strategic heat sources can thus be low-temperature decentralised renewable such as solar thermal, geothermal heat, or excess heat recovered from compressor machines

Scenario building for strategic heat planning

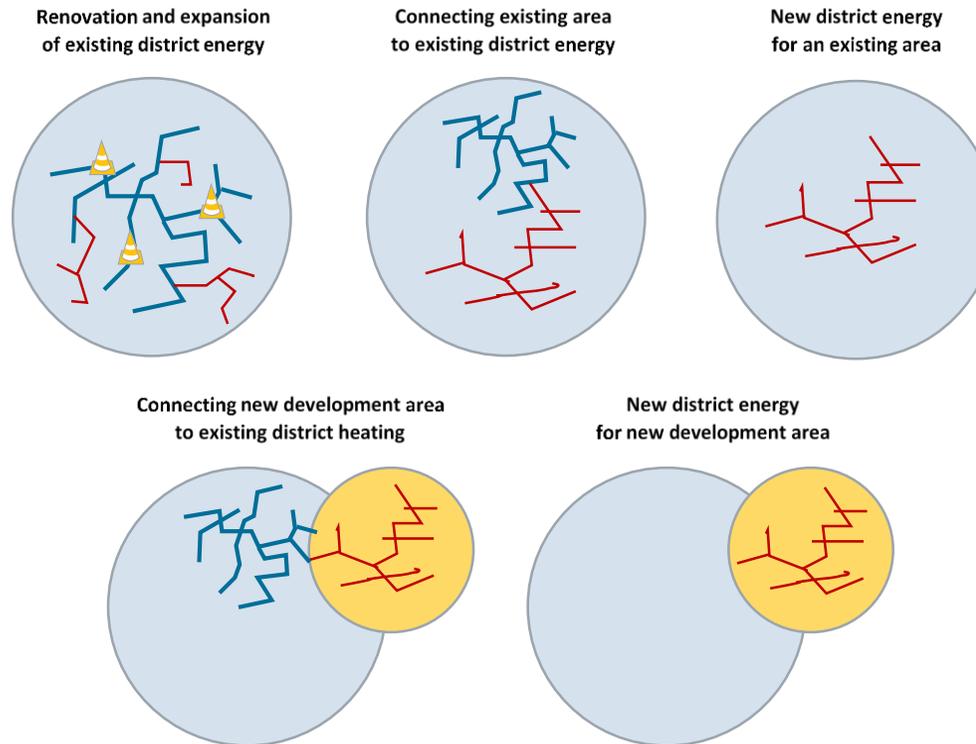

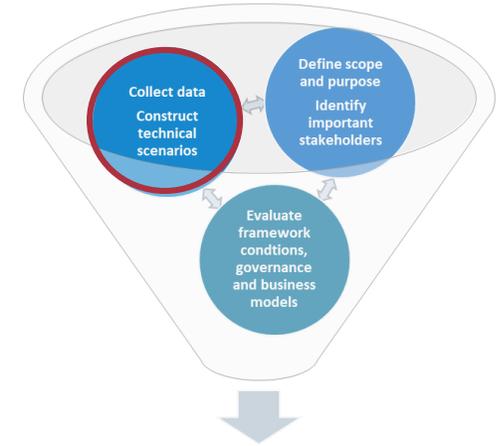

3. Quantify and assess heat-saving potentials

Scenario building for strategic heat planning

4. Establish scenarios for heat supply

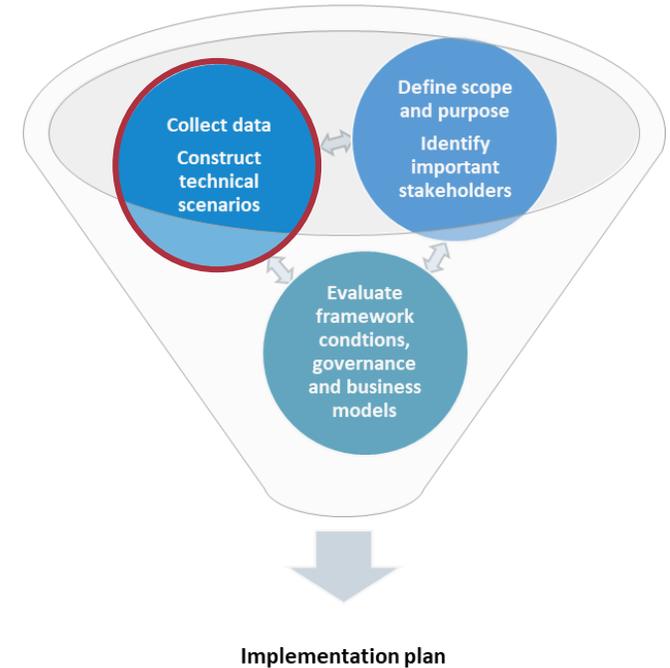

- When establishing these scenarios, keep in mind the i) scope, ii) perspective and iii) timeframe of energy systems analysis
- Do not make them too detailed at first! Easy to get lost in technical or legal details. It is important to keep the process moving. Include the level of detail needed to make decisions and move further.

Scenario building for strategic heat planning

Methodological points for scenario building:

- Energy system scope:
 - *Include entire energy system to identify synergies*
- Data is important:
 - *Good quality heating data is vital*
- Timeframe:
 - *Ensure that scenarios are in line with long-term targets*
- Differentiate between socio-economic and business economic prices:
 - *Taxation, subsidies, externalities etc. influence the result. Use costs that are relevant to society and not supporting status quo.*
- Important to remember that strategic heat planning is not business as usual

Enabling Framework Conditions, Financing and Business Models

Ownership structure

Interests and monopoly
Who owns the distribution infrastructure?

Pricing

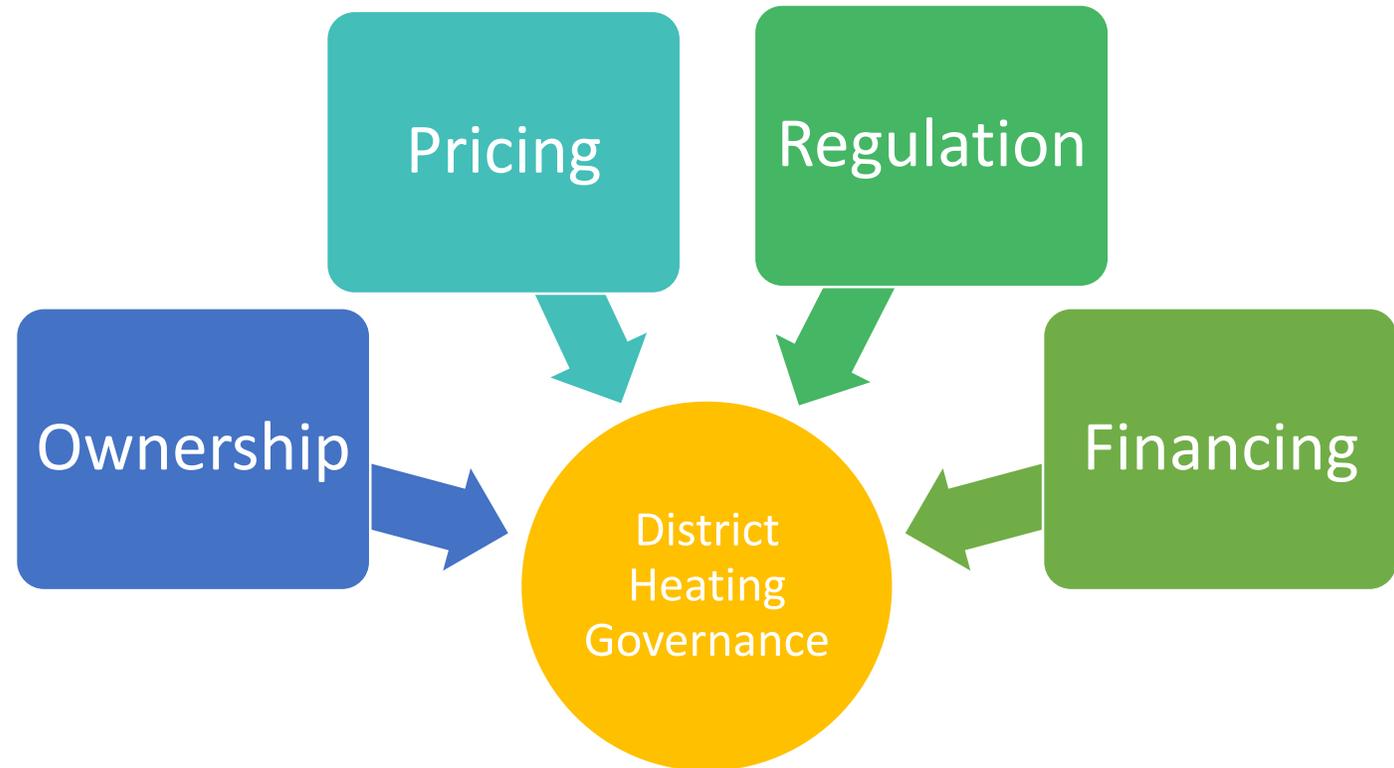

What heat pricing mechanisms are being used?

Regulation

Is there specific district heating regulation?

Financing

Is it possible to ensure a long timeframe for the return on investment?

Enabling Framework Conditions, Financing and Business Models

Three typical barriers:

Challenge 1: Level playing field

Recommendations:

- Fiscal levers
- Specific district heating legislation
- Consider district heating grids as infrastructure
- Consider externalities: decarbonisation, supply security, air quality

Challenge 2: Lack of governance tools to implement district heating

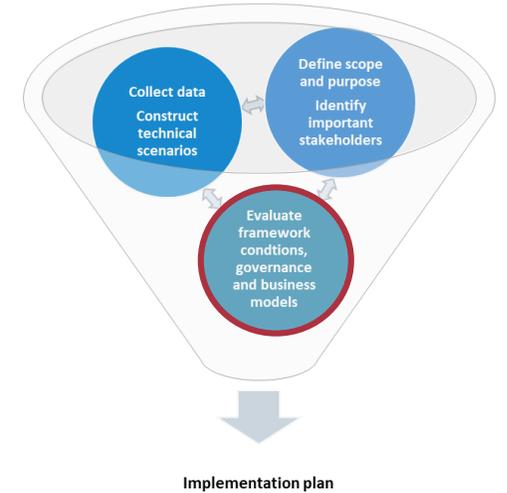

Recommendations:

- Feed back needs and ideas to national authorities and legislature. Create awareness of lacking tools.
- Identify what is possible within current regulatory framework

Challenge 3: Overcoming barriers to investment

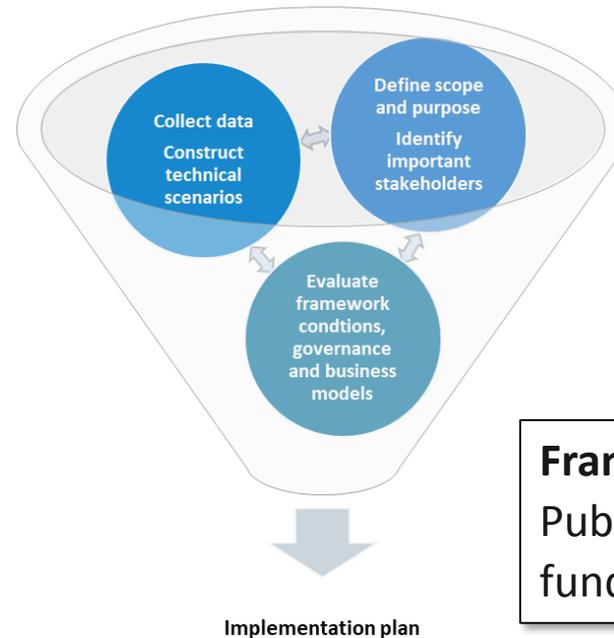

Recommendations:

- Picking low-hanging fruits: start with high-demand consumers,
- Government intervention through economic and financial instrument
- Capacity building for authorities and heat market stakeholders

Scope, Purpose and Stakeholders in Strategic Heat Planning

Case study: Zhengzhou Municipality included urban planners, architects, construction contractor, future building owners (mainly financial companies), distributor company and the heat supplier (water treatment factory) for planning new district heating systems

Technical scenarios:

- Interaction with buildings to achieve energy savings
- Use the wastewater heat

Scope and purpose:

1. Replace all coal-fired energy production
2. Increase energy efficiency in buildings by 15%
3. Reduce air pollution levels

Framework and financing:

Public endowment fund – to recirculate funds for new district heating investments

- ReUseHeat – exploiting urban excess heat: [link](#)
- KeepWarm – Renewing district heating: [link](#)
- IRENA & AAU – Guidebook: Facilitating the integration of low-temperature renewable energy in district heating and cooling – *Soon published*

Strategic heat planning and the integration of low-temperature renewable energy sources in DHC

Strategic Heat Planning is an iterative, multidisciplinary and continuous process

Key Success Factors:

Scope and purpose

- Identify main stakeholders
- Identify drivers for district heating projects

Technical scenarios

- Measure heat demand
- Identify potential heat sources
- Balance heat savings and supply
- Establish scenarios

Evaluate Framework conditions and business models

- Ownership
- Financing
- Pricing
- Regulation
